

CAMSE Certified Asset Management Security Expert

BRIDGING THE GAP BETWEEN IT ASSET MANAGEMENT – ITAM AND IT SECURITY

The intent of security is to manage risks and the extent of the loss after an incident. This simplistic definition does not do justice to the enormous scope of organizational security and the complexity of the processes required. The investment in security processes, automation and professionals has been significant for most organizations and continues to consume budgets on an ongoing basis, from physical security to the myriad of types of information security. Yet, organizational security is routinely rated poorly, especially with the rapidly growing threats to information security. At the same time, the consequences from these failures escalate as laws are put in place to protect individual privacy, create reporting requirements and demand accurate inventory information on which to build security processes. The responsibility for securing the organization and its data is a priority for most organizations and should be part of every employee's responsibility.

IAITAM is convinced that to have a successful IT security program, the organization must implement the function of ITAM.

The mission of IAITAM's CAMSE course is to maximize the contribution of IT Asset Management professionals to the information security and physical security of the organization by bridging the gap between ITAM and IT security processes while incorporating security strategies throughout the ITAM policies, processes and procedures so that ITAM enhances the security program and improves the applicable governance.

◇ WHO SHOULD ATTEND

The CAMSE Course is designed for those individuals with an understanding of how the ITAM program is managed within an organization or for IT security professionals wishing to understand how ITAM empowers IT security. It is essential learning for IT Asset Managers and other professionals involved in Asset Management, strategic planning, security programs and those affected or influenced by ITAM and security initiatives.

◇ WHERE TO START: LET CAMSE GUIDE YOU

This course exposes the attendee to new concepts as to how the ITAM program benefits and relates to security initiatives. IT asset lifecycle management is relevant for security initiatives as a critical IT base and provides the student with a means of working with and understanding the roles and responsibilities of those persons who will implement, manage and direct security initiatives for their organization.

The CAMSE course consists of the following components:

CAMSE Course Manual

CAMSE Course Presentation Slide Book

CAMSE instructor daily presentation and interaction with attendees – administered in-person or online

Optional CAMSE Comprehensive Online Examination necessary for achieving CAMSE Certification
